

WIRY BROWN ALGAE. 3rd EDITION

Images used below

Unless acknowledged otherwise, all images come from pressed specimens or the extensive slide collection of the algal unit, State Herbarium of S Australia, collections generated by the late Professor Womersley and his workers over some 60 years. Images with dark backgrounds have been taken using phase contrast or interference microscopy to highlight transparent structures. Other images may be stained dark blue.

Scale

The coin used as a scale is 23 mm or almost 1" across

Descriptive names

Those marked ^s come from Edgar, G. *Australian Marine Life, 2nd Ed.* (2008)

Limitations

Unfortunately, to use this key, microscopic investigation of specimens may be needed.

This key is restricted to brown algae 10-500 mm tall, many of which have prominent hair tufts, cylindrical branches up to 3 mm wide, equal-sided cells when viewed microscopically in cross section (see Fig. 33).

Most belong to the Family: Sporochneaceae.

EXCLUSIONS:

1. soft and slimy, worm-like algae of many threads interwoven together, ending in beaded chains of cells, **or** thread-like algae consisting of single chains of exposed cells (examples opposite).
These are covered in the key **"Turf and fouling algae III: encrusting, thread- and worm-like brown algae"**
2. brown, algae with stiff, upright threads or filaments in tufts, only about 10 mm tall, with prominent tip cells when growing actively that produce lines of cells dividing lengthwise forming **prominent bands** along threads (example below)
These are covered in the key **"Sphacelaria (including Herpodiscus)"**
3. algae with narrow, flat, ribbon-like or hollow blades only about 10 mm wide, **or** regularly forked
These are covered in the key **"ribbon-like Brown algae"**

soft, *slimy* brown alga, (*Cladosiphon*) – **excluded** from this key

brown algae of interwoven *threads* ending in beaded chains of cells - **excluded** from this key

brown alga (*Scytosiphon*) with narrow, **ribbon-like** blades – **excluded** from this key

brown alga (*Dilophus*) with narrow, **ribbon-like** blades regularly forked – **excluded** from this key

brown alga (*Cutleria*), **ribbon-like** blades with split ends – **excluded** from this key

small brown alga (*Sphacelaria*) with **prominent apical cells** (arrowed) stiff, narrow, **banded** branches and uniquely shaped propagules (**prop**)

KEY

- 1b. branching usually dense, tufted, unless plant is **denuded**, young branches **banded** microscopically or in **rings** about axes unless plant has been denuded 14.
- 1a. branching open, branches, **not** banded, short laterals **not** in rings 2.

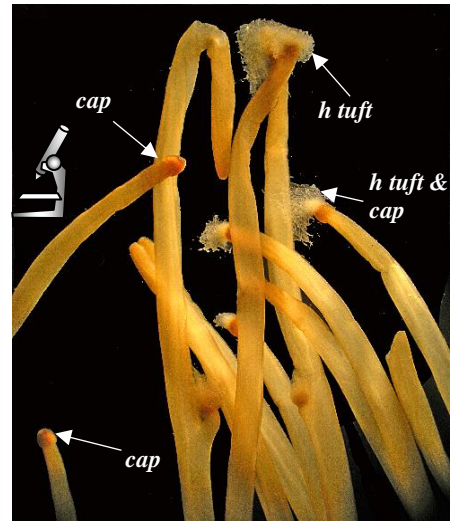

- 2a. dried plants almost black, stiff, wiry, several main branches (axes) densely covered with shorter, upright, radial side branches tipped with **microscopic caps**, also with hair tufts if growing rapidly; plant base becoming thick and warty with age, up to 100 mm wide. Figs 1-3 *Perithalia caudata* (§ Spiky tuftweed, Mermaid's hair)
- 2b. plants pale- to dark-brown, variously branched; often with prominent hair-tufts at tips, plant bases smaller 2.

- 2a. prominent hair-tufts at tips of numerous short, wiry or peg-shaped **side** branches 3.
- 2b. hair-tufts fringe all branch surfaces **or** are found only at branch tips **or** are absent 10.

- 3a. side branches arise from common points on main branches (axes) (like struts of an umbrella); hair-tufts at tips are large (like powder-puffs). Often growing in coarse sand. Figs 4, 5. *Bellotia eriophorum* (§ Chimney-brush seaweed™)
- 3b. side branches arise radially or in 2 rows along the axes 4.

- 4a. plants consist of single main branches (axes) and long, spreading side branches fringed with small, wiry branchlets tipped with hair-tufts 5.
- 4b. plants consist of several axes fringed with small branchlets tipped with hair-tufts 7.

- 5a. plants often large (200 mm-1,000 mm tall), bases often covered with a felt of hairs, side branches **spreading**, bearing thin branchlets tipped in hair-tufts. When fertile laterals and bases of branchlets are covered with microscopic hairs bearing spore-sacs in rows on one side. Figs 6-9 (next page) *Encyothalia cliftonii* (§ "Tuft-weed")
- 5b. not as above 6.

Figs 1-3: *Perithalia caudata*,
 Above: whole plant
 Right, above: branch tips, tip cups, some also with hair tufts
 Right, below: detail of tip-cup

Fig. 4: *Bellotia eriophorum* growing in sand, Dutton Bay, SA. Photo: D Muirhead

Fig. 5: *Bellotia eriophorum*, side branches arising in bunches from one point

Figs 6-8: *Encyothalia cliftonii*

- Far left: whole plant
- Centre: detail of laterals bearing radial branchlets with terminal hair-tufts
- Above: detail of tufted branchlets

Fig. 9: *Encyothalia cliftonii*: fertile microscopic hairs (bracketed) with bulbous tips arising from the surface of a lateral and bearing cigar-shaped sporangia (arrowed) on one side

- 6a. axes narrow (0.2-0.4 mm wide); branchlets numerous, the hairy tufts at their tips producing an overall woolly appearance to the plant; fertile branchlets have a short stalk. Figs 10-12.

..... *Sporochnus pedunculatus*
 *Yee (2007) found some specimens included under *Sporochnus comosus* in the *Marine Benthic Flora* belong to this cosmopolitan and variable species

- 6b. axes thicker (0.5-1.5 mm wide), fertile branchlets are *stalkless*. Figs 13-15

..... *Sporochnus apodus*

- 7a. plants large, 200-900 mm tall, tree-like; axes thick, 1-2 mm wide with a prominent disc-shaped holdfast; side branches divided several times. Figs 16-18.

..... *Sporochnus radiformis*

- 7b. plants smaller, branching more open, holdfast less conspicuous 8.

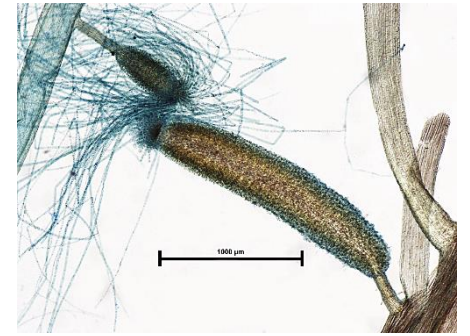

- 8a. branchlets long, thin, and when fertile have a relatively long stalk (2-10 mm) Figs 19-21 (next page)

..... *Sporochnus moorei*

- 8b. fertile branchlets with a short stalk 9.

Figs 10-12: *Sporochnus pedunculatus*
 Above: whole plant

Right, above: young, stalked fertile branchlets
 Right, below: developing and mature branchlets

Figs. 13-15: *Sporochnus apodus*
 Left: whole plant
 Above: two magnifications of stalkless, fertile branchlets

Figs 16-18: *Sporochnus radiformis*
 Left: whole plant
 Above: basal pad

Above: stalked fertile branchlets

*Yee, N. R. (2007). *Phylogenetic Studies of the Marine Brown Algal Order Sporochnales (Phaeophyceae)*. Ph.D. thesis, School of Botany, University of Melbourne

Figs 19-21: *Sporochnus moorei*
Whole plant

Above: linear side branches

Above: fertile branchlets with long stalks (*st*)

9a. plants much-branched; fertile branchlets elongate with sterile sections just below the tuft of hairs at tips. Figs 22-23.

..... *Sporochnus stylosus*

9b. plants may be excessively hairy; fertile branchlets egg-shaped, becoming elongate and sometimes curved, sterile sections below the tips are **absent**.

Figs 24-26 *Sporochnus comosus*
according to Yee, 2014, only some of the specimens listed under this name in the Flora belong to this species; the others belong to *S. pedunculatus* (see above)

Figs 22, 23: *Sporochnus stylosus*

Left: whole plant

Above: fertile branchlet, stalk (*st*), sterile section (*style*)

10a. branches somewhat compressed and when fertile, tips end in unique cup-and-cone shaped structures, but when non-reproductive, they bear dense hair tufts that are, however, readily shed.

Figs 27-30 *Carpomitra costata*

10b. branches cylindrical; cup-and-cone structures **absent**; hairs usually prominent 11.

Figs 24-26 *Sporochnus comosus*

Above: whole plant

Right, above: detail, dense branchlets tip-hairs

Right, below: stalked fertile branchlets, dense

Figs 27-30: *Carpomitra costata*

Top: wiry branches ending in prominent hair-tufts
Below: fertile cup-and-cone tips

Above: tips with dense hairs

Above; fertile cup-and-cone tip in lengthwise section, minute spore sacs (*spor*)

- 11a. branch surfaces swathed in masses of **long, individual**, coloured hairs.
Figs 30-33.

..... *Sporochmus herculeus*
as *Sporochnema tomentosum* in the

Flora
rare: only known from 22-30m deep at
two sites in S Australia

- 11b. branch surfaces hairless, **or** with hairs in discrete **patches** 12.

- 12a. hairs in dense **patches** scattered along branch surfaces giving the plant a fuzzy appearance; microscopic spore sacs (sporangia) occur at the base of hairs.
Figs 34-36.

..... *Austronereia australis*

- 12b. hairs at branch tips **or** hair-like side branches in rings around branches
..... 13.

- 13a. hair-like side branches in rings of 4; main branches in **opposite pairs**. Figs 37 38.

..... *Arthrocladia villosa*

Family: Arthrocladiaceae
rare: one collection only from Pt Stanvac, S Australia, probably introduced from temperate N Hemisphere waters

- 13b. hair-tufts at branch tips; branch surfaces bumpy due to microscopic, globe-shaped outgrowths. Figs 39-41 (next page)

..... *Nereia lophocladia*

rare: only known from one collection at Pt Phillip Heads, Vic

Figs 30-33: *Sporochmus herculeus*
Above: two images of hairy branches
Right: cross section showing equal-sided cells (parenchyma)

Figs. 34-36: *Austronereia australis*
Right whole plant
Far right: two magnifications of hair-patches on branch surfaces, the lower image showing minute spore sacs at bases of hairs

Figs 37, 38 *Arthrocladia villosa*
Left: whole plant
Right: hair-like side branches in rings of 4

(from previous page)

Figs 39-41: *Nereia lophocladia*,
 Above: whole plant
 Right: stubby laterals with tufts of long filaments apically
 Far right: branch tip, globe-shaped outgrowths on surfaces (arrowed)

(From step #1:
 young branches **banded** microscopically **or** in **rings** about
 axes unless plant has been denuded)

14a. laterals radially branched; axes
 microscopically **banded** when young
 15.

14b. stubby laterals **in rings** about axes, **not**
 banded when young.
 Figs 42-45 ... *Cladostephus spongiosus*

15a. axes naked (un-corticated) except for
 rhizoids, end branch tufts brush-like,
 edges may be of a lighter colour.
 Figs 46-49 (next page).

..... *Halopteris* 5 spp
H. paniculata, § Twisted filamentweed
 is illustrated

15b. main branches coated (corticated)
 with additional cells, rhizoids
absent. Figs 50-53 (next page)
Phloiocaulon 2 spp
 *P. spectabile* is illustrated

Figs 42-45 *Cladostephus spongiosus*
 Above, right: whole plant, not denuded
 Left: plant denuded of characteristic rings of short branches, thin, wiry axes only remaining
 Centre and right: characteristic rings of side branches of two lengths, highly magnified.

Figs 46-49 *Halopteris paniculata*
Variation in branching patterns of two plants

Upper: banded axis
Lower: bunch of stalked sporangia

Figs 50-53 *Phloiocaulon spectabile*
Above: whole plant (left) and detail of young (uncorticated) branches (right)

Below: cross sections showing central core of squarish cells and comparing a young (uncorticated) branch (left) with an older corticated branch (right)

Some additional Brown algae may become denuded of their characteristic side branches and so appear wiry, but careful investigation of specimens should distinguish them from the species in the above key.
